

How to Measure for Your Mantel

Measuring for your mantel is as simple as filling in the blanks on our on-line [order form](#). Read the following instructions carefully and feel free to [contact us](#) with any questions.

- A. Facing Width: This is the measure of the width of the facing material (brick, tile, stone) that surrounds your firebox.
- B. Facing Height: This is the measure of the height of the facing material that surrounds your firebox.
- C. Facing Thickness: This is the measure of the amount the facing material (brick, tile, stone), protrudes from the surrounding wall surface. Make this measurement at several places around the perimeter of the facing material. List the greatest measurement on this line.
- D. Hearth Width: This is the measure of the total width of the hearth.
- E. Hearth Depth: This is the measure of the total depth of the hearth.
- F. Distance to anything that would limit mantel shelf width.

Be certain to check the firebox manufacturer's specifications and local building codes to ensure minimum clearances to combustible materials. We will use this information to produce a computer generated scale drawing indicating all critical dimensions. Please look this over carefully to ensure that is correct and that there are no light switches, gas valves, etc. that would prevent installation.
